

## INCREDIBLE TOOLING

Build features quickly with simple, declarative templates. Extend the template language with your own components and use a wide array of existing components. Get immediate Angular-specific help and feedback with nearly every IDE and editor. All this comes together so you can focus on building amazing apps rather than trying to make the code work.

```
1 import { Component } from '@angular/core';
2 @Component({
3   template: `
4     <h1 [style.font]="font">{{title}}</h1>
5     <div>{{person.address.}}</div>
6     <span (c latitude
7   })
8   export class street
```

The image shows a code editor window with a dark theme. The code is an Angular component definition. On line 6, the text `<span (c latitude` is highlighted, and a tooltip menu is open showing three options: `latitude`, `longitude`, and `street`. Each option in the tooltip is preceded by a small icon of a key with a circular arrow, indicating they are properties or methods of the component.
